

Personal resume

Basic Information

Name: Cui Yifan
Ethnicity: Han
Phone: +86 138-1013-4556
Email:
cuiyifan12345@gmail.com
Address: Guofeng
Shangguan, Wangjing,
Chaoyang District, Beijing,
China

Date of Birth: January 18, 2003
Height / Weight: 180 cm / 65 kg
Political Status: Applicant for Communist
Party Membership
Graduation Institution: Boston University,
USA
Education Level: Graduate Student

Education Background

Boston University | Boston, MA, United States

Master of Science in Business Analytics (MS in Business Analytics)

Sep 2025 – Mar 2027 (Expected)

Core Coursework:

Data Mining, Machine Learning, Business Analytics Modeling, SQL and Data Management,
Predictive Analytics, Business Decision Optimization

Northeastern University | Boston, MA, United States

Bachelor of Science in Mathematics and Business Administration

Sep 2021 – May 2025

Core Coursework:

Linear Algebra, Probability and Statistics, Mathematical Reasoning, Calculus I–III, Financial
Accounting, Managerial Accounting, Corporate Finance

Internship Experience

National Institute of Financial Research, Tsinghua University | Beijing, China

FinTech / Data Research Intern

Aug 2024 – Nov 2024

- Participated in training projects for large language models (LLMs) in financial domains; assisted in constructing, cleaning, and annotating financial text datasets
- Supported model testing and performance evaluation for financial Q&A, research report summarization, and risk identification tasks
- Assisted in structuring financial corpora and feature engineering to improve model understanding and generation performance in financial scenarios
- Organized research materials and contributed to interim result presentations and research documentation

China Life Asset Management Co., Ltd. | Beijing, China

Intern, Financial Technology Department

Jun 2023 – Aug 2023

- Collected, cleaned, and organized market, financial product, and investment portfolio data to ensure data quality
- Applied statistical analysis methods to identify market trends and support internal research and analytical reports
- Participated in industry and competitor research; assisted in preparing asset management and financial technology industry analysis reports
- Supported projects involving data modeling, algorithm testing, and system validation to improve analytical workflow efficiency

Skills & Strengths

- Basic programming capability in **C++, Java, and Python**
- Proficient in office software including **Word, Excel, and PowerPoint**
- Strong mathematical logic and advanced mathematics foundation
- **TOEFL score: 108**; fluent in English conversation and academic writing
- Systematically studied **Accounting and Marketing**, with solid financial knowledge
- Excellent athletic ability; proficient in **skiing, basketball, soccer, table tennis, and swimming**; served as **President** during high school

I went from Performance-Oriented Approach to Problem-Oriented Approach of Learning. While studying for my undergraduate degree in Mathematics & Business Administration, I remember the early concept of learning was grades and application of the formulas I knew to be correct for me even when I didn't totally get the impact of what they meant. Yet modelling and analytical studies taught me that theoretical derivations wouldn't solve every problem. I created a model using textbook techniques so that I could build up the model on an early modeling project. By constant discussion with teammates and teaching assistants, I realized that the problem was not technical correctness, but rather a lack of awareness of the data's background and assumptions. I reanalyzed the data generation logic as well as changed the assumptions of the model and gave explicit definitions for the limits of the results. You get the whole idea. This learning made me learn from a problem, instead of applying process to solve, which was the basis for future research and applied course.

Working with others to work on team-based projects helped me develop my own sense of responsibility and cooperation -- two things that are required from every team member. In a number of the larger group assignments, I also saw massive skill and task mismatches causing work to be in duplicate or unbuilt and slow progress to start. During a Business Analytics course, I had the responsibility for task and progress organization and coordination. I also split tasks using data processing and analytical modeling as I moved over to report presentation, clearly assigning responsibility and schedules. I also integrated and monitored the results at each stage in time for analysis consistency. And so, the project finished on schedule and the end result was clearly better. From this I learned that it is better to have forward coordination and accountability than focus individually.

The Personal Triumph to Break Into the Walls of Tech. For an image processing course I needed to write some image processing algorithms in C++. I knew little because of my lack of engineering experience and I found debugging and code structures challenging and that took me a lot of time. For repeated failed attempts, I decided to divide the problem into smaller modules, check the functioning of each module and iteratively progress the implementation based on test logic, technical information and example code. I went from only making it work to writing that was much stronger and more readable. And in the end, the project did work. More to the point, I learned that in difficult problems longer effort, a methodical breakdown, gradual problem solving was more valuable than hurrying for a rapid result.

Find a balance between rigor and practicality. Interdisciplinary studies in mathematics and business led me to see that the academic "optimal solution," which may be appropriate, is not always the "feasible solution" in real-world settings. In case studies and business courses, I learned to analyse analytical conclusions and evaluate their practicality, evaluating data acquisition costs, implementation difficulty and risk. This change of attention compelled me to concentrate on the practical results of analytical results, not only theoretical correctness but also as a person - it provided a solid cognitive building block for the success I found in finance and data internships.

The effect of academic training on professional skills in the long run. Here are the skills and habits that have been acquired and developed through both my undergraduate and graduate studies:

- Quickly familiarize yourself with new domains and issues and execute on them seamlessly.
- Propelling project progress with a team outlook.
- Realizing and breaking technical and cognitive bottlenecks to achieve personal breakthroughs with technological and mental breakthroughs.
- Balancing theory and the pragmatic.

These are skills that have helped me move seamlessly from student to professional with a seamless transition so that as best as possible from student to practitioner, I can get on and go when performing and continue learning while processing and implementing complex assignments.

Seeking opportunities in Business Analytics, Data Analytics, Financial Analytics, Applied Data Science, and Analytics-Driven Consulting, including but not limited to roles such as Business Analyst, Data Analyst, Business Intelligence Analyst, Financial Data Analyst, Risk Analyst, Applied Data Scientist, Analytics Consultant, Product Analyst, and Decision/Strategy Analytics Analyst. With a strong foundation in mathematics and statistics, along with formal training and practical experience in machine learning, data mining, predictive analytics, business analytics modeling, and SQL-based data management, I am capable of executing end-to-end analytical workflows ranging from data acquisition and preprocessing to modeling, interpretation, and insight delivery in complex business and financial contexts. I aim to translate quantitative analysis into actionable insights and decision-support solutions, contributing to data-driven decision-making, business and operational optimization, and risk analysis, while continuously developing domain expertise and analytical depth in cross-functional and interdisciplinary environments.
